

Roll covers in the paper machine Dryer section

Dryer section

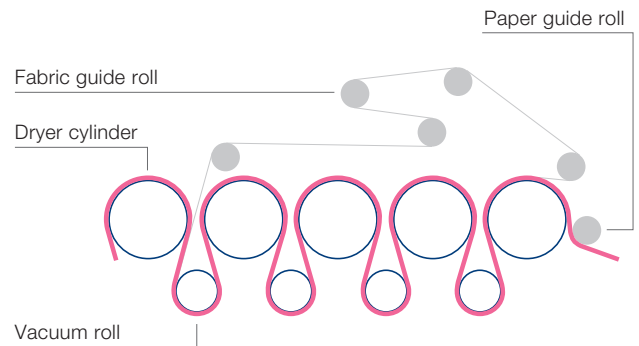

Voith Paper offers a range of roll cover applications for the dryer section. Hard metal coatings protect the drying cylinders from wear. Our product portfolio also includes a range of composite guide roll covers.

Thermal coatings consist of a corrosion and wear resistant layer, ensuring surface and geometric stability of the guide roll or cylinder. Dirt repelling versions help keep the surface clean and improve sheet release.

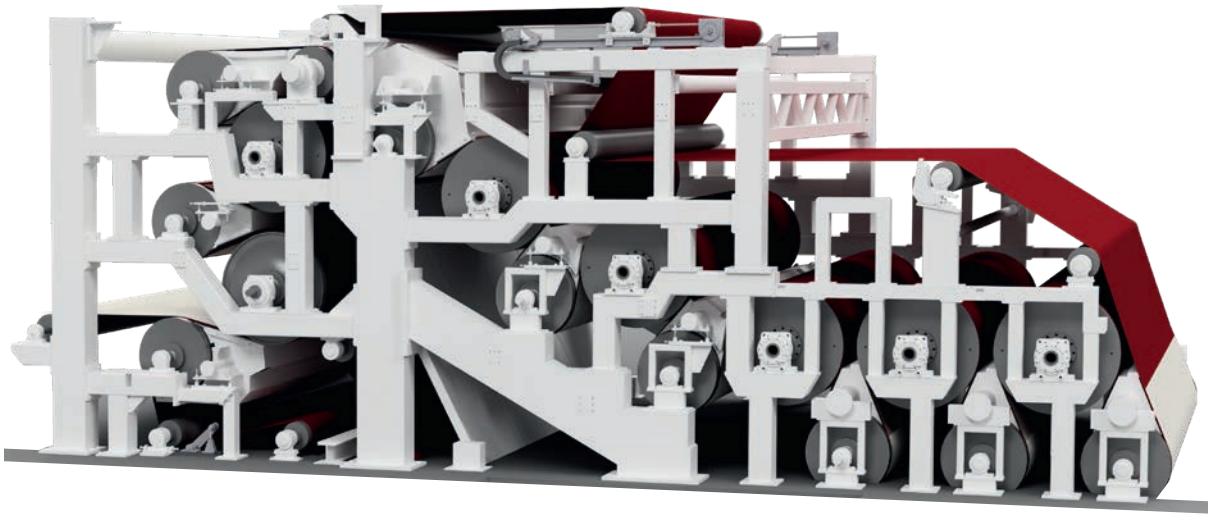

Composite covers can be easily applied to those roll shells which are in relatively poor condition. They provide excellent resistance to corrosion and abrasion and are antistatic.

Coatings can be applied either on site or during service work in one of our locations equipped with thermal spraying. Composite coatings can only be performed inhouse at Voith.
